

Lab 2

CSC154

Daniel Hammon

TTH 5:30pm

Jordan Penaloza

## Lab 2 Overview:

In this lab we will be covering various cryptology topics found in the chapter 2 exercises of the textbook.

### 2.1 - Encoding and Decoding

Type	Hallmarks	Example
Binary	ones and zeros	01001000 01100101 01101100 01101100 01101111 00100000 01010111 01101111 01110010 01101100 01100100 00100001
Decimal	numbers only	72 101 108 108 111 32 87 111 114 108 100 33
Hexadecimal	numbers and letters a-f	48 65 6c 6c 6f 20 57 6f 72 6c 64 21
Base64	numbers, upper and lowercase letters, and special characters +, /, and =	SGVsbG8gV29ybGQh

Here are the encoding examples in the textbook.

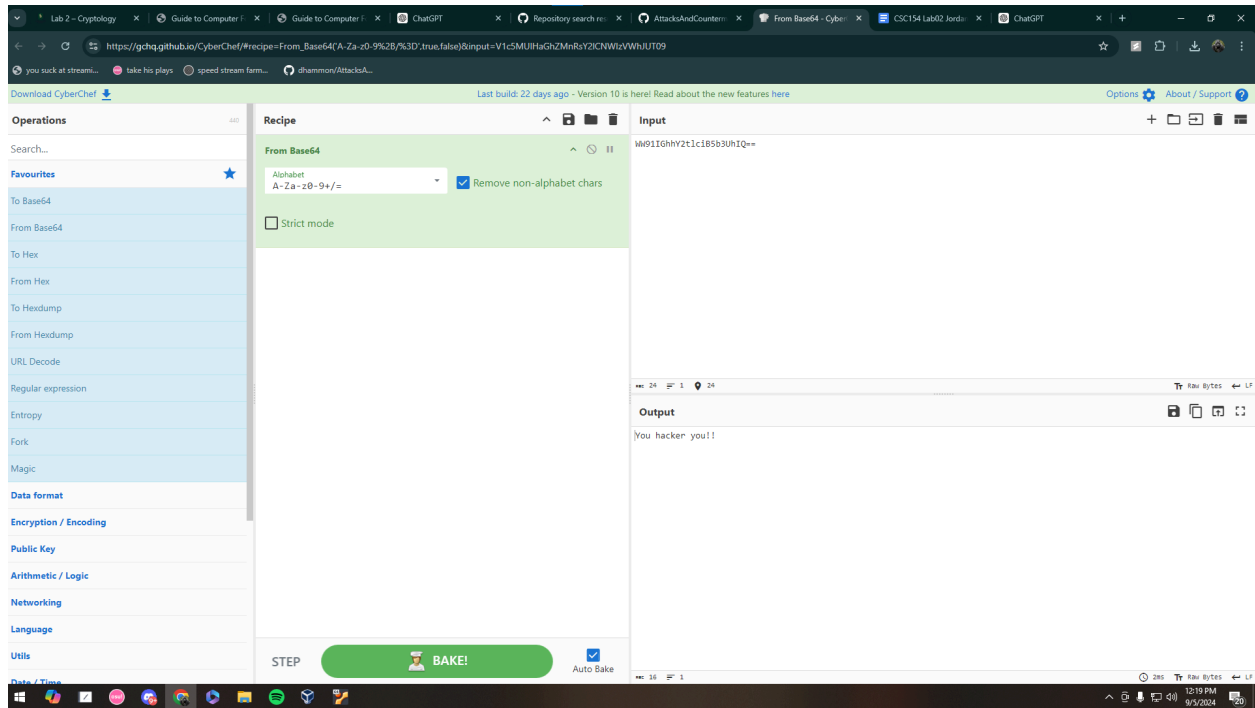

Step 1

Using the encoding patterns learned in this chapter, identify each strings' encoding:

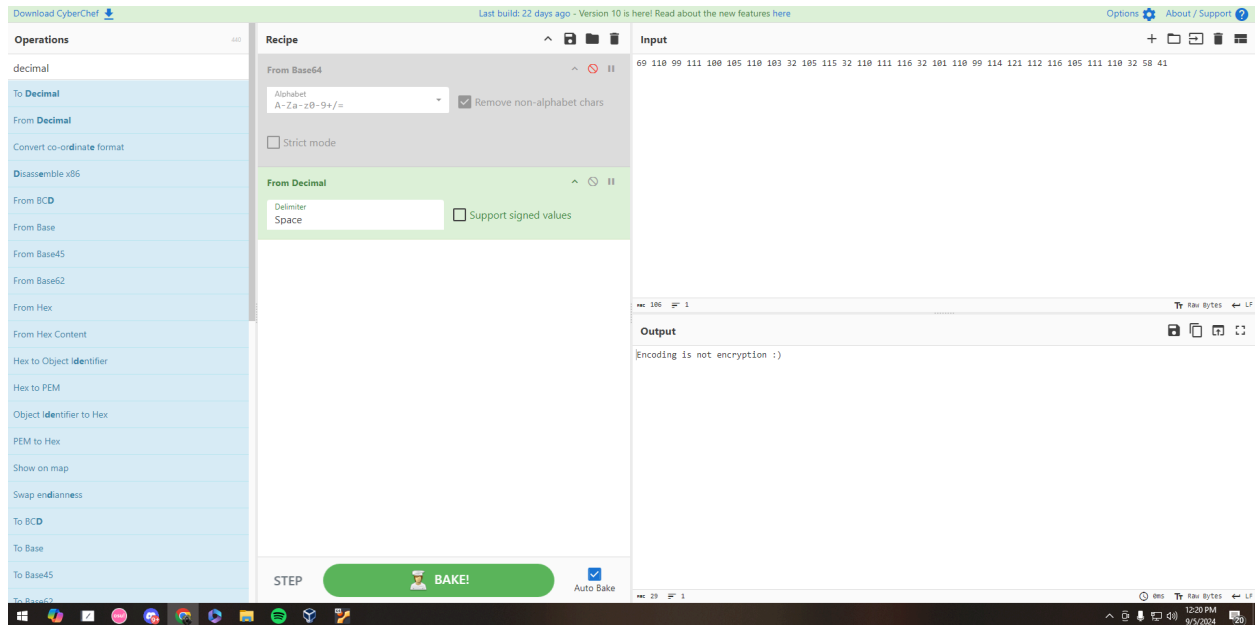

- Ww91IGhhY2t1ci85b3UhIQ==
- 69 110 99 111 100 105 110 103 32 105 115 32 110 111 116 32 101 110 99 114 121 112 116 105 111 110 32 58 41
- 77 30 30 74 20 77 30 30 74
- 48 65 78 20 69 73 20 63 6f 6d 6d 6f 6e 6c 79 20 75 73 65 64 20 77 69 74 68 20 61 73 73 65 6d 62 6c 79
- 01101111 01101110 01100101 00100111 01110011 00100000 01100001 01101110 01100100 00100000 01111010 01100101 01110010 01101111 00100111 01110011

1. Base64
2. Decimal
3. Hexadecimal
4. Hexadecimal
5. Binary

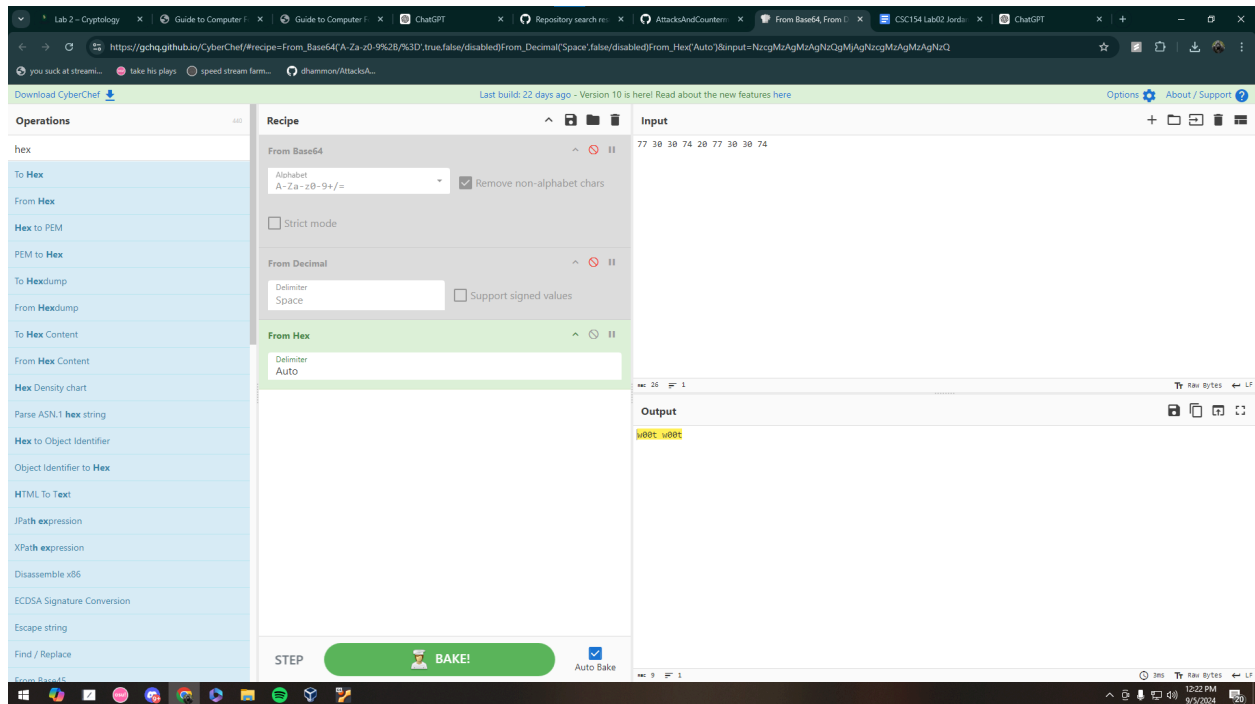

Step 2 was to decode each of these using cyberchef

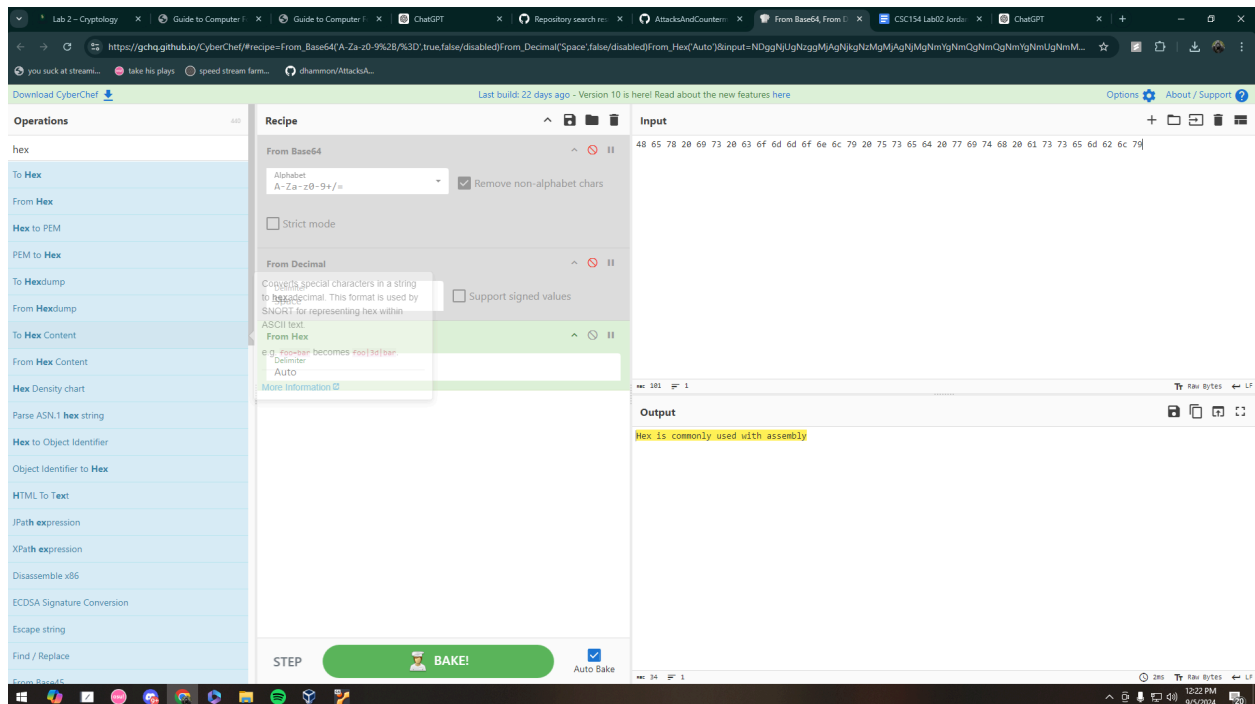

You hacker you!!

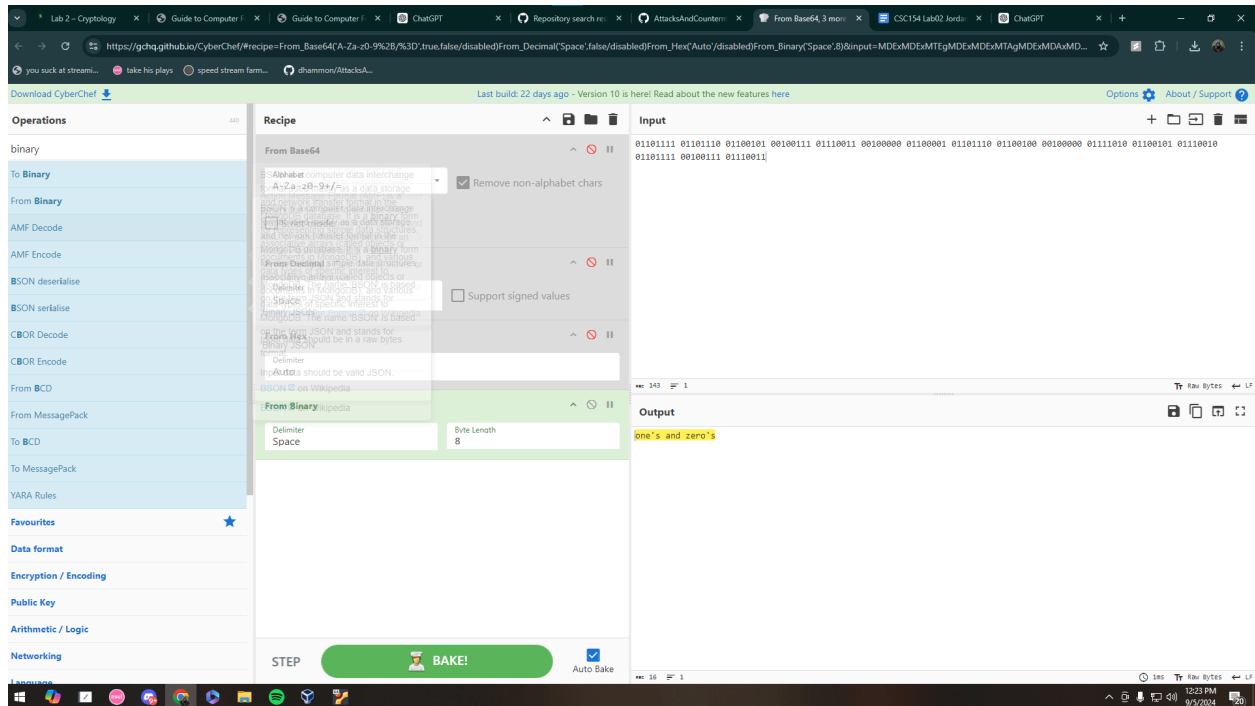

Encoding is not encryption :)

w00t w00t

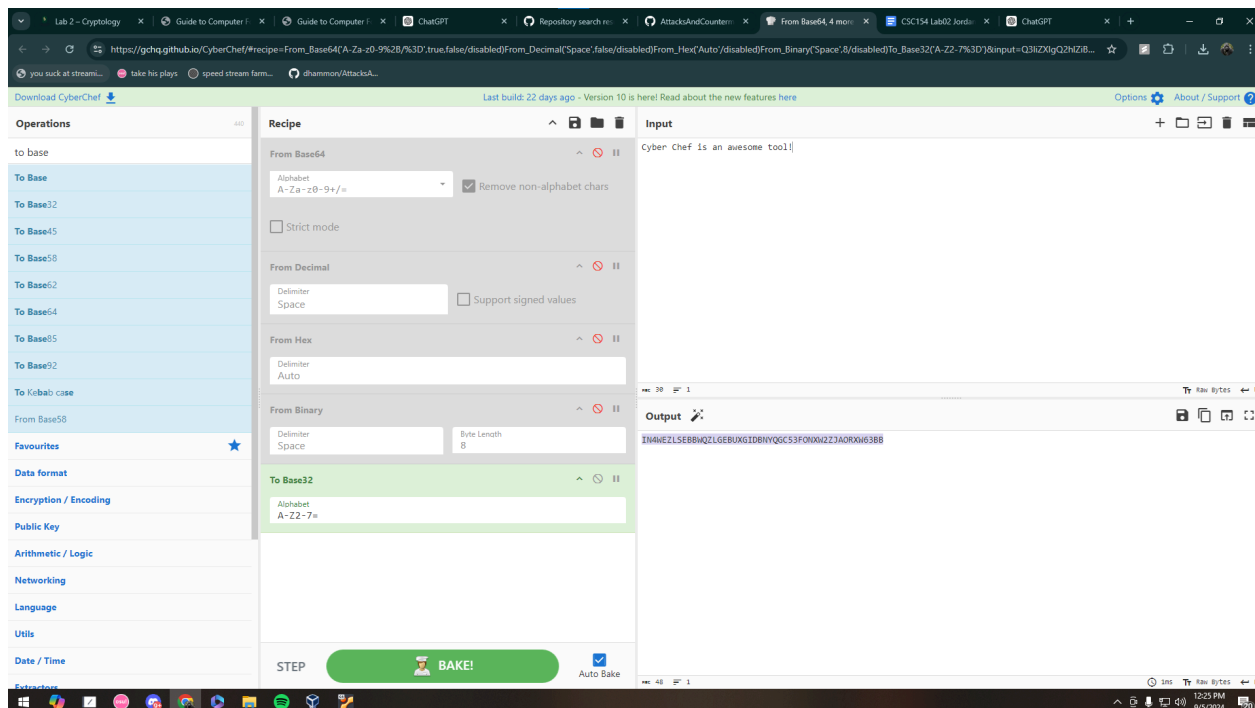

Hex is commonly used with assembly

one's and zero's

In step 3 we will encode the following string “Cyber Chef is an awesome tool!” into base32 using cyberchef.

IN4WEZLSEBBWQZLGEBUGIDBNYQGC53FONXW2ZJAORXW63BB

## 2.2 - Keyspace

We will now be using keyspace in openssl on the ubuntu machine to generate random keys.

```
jordan@ubuntu: ~/Desktop
jordan@ubuntu:~/Desktop$ openssl rand -base64 32
PmKSIdatYXgY+1K7xAMpqiF977cliGZIavpgrfPNMk=
jordan@ubuntu:~/Desktop$ openssl rand -base64 128
BaqHAFNMywbxRXc3VReBr2DNTEHCrt5EgjY6B0WIXqU6DT5HEMMJyfiH+7jrH90
Szn5MAkt3gTaAtI+IV+cFwa5AAsMnSrAI/FkAx2470mAg3uaM/m0qMgI0/cP+AJo
Br/gSGRh9JLrIjIB+CsCT3IXYuQ5QJSytkhvTPtXx0M=
jordan@ubuntu:~/Desktop$ openssl rand -base64 256
NJ4Ql+XQfQH5Bl+HBo1CgCp06JhA7l51bdGsgKuokHoC/1MCBE0UrFcR70PcRmgu
Zenxy55eLffAo40AWjalVApTuSbD7UxFvsie4P967pPDWVg9AxSTFEx2QuYhEKvA
BeqjKEZmIfDIld08ztf/jq0y/07y8x8u0Mxx2+k5+tZih7T+KaMpRUTUbuk/gtoa
c/izQlawcMBbFvIZtmxfJl4/bgQWdGiXb6cK1niGpYkGit4GNjRMoUKdLgdL+Z70
Om0/Uhj/Mmh/fG6whFIzLK6lCkf/PSdoI6Vn4lRx+6Hd0axlWv4ymfxWYM2qg2Gu
MvVz/jnEl53K04GIExnHEQ==
jordan@ubuntu:~/Desktop$ S
```

Here are the keys we generated

## 2.3 - Symmetric Encryption

```
jordan@ubuntu:~/Desktop$ echo "some secret message" > plain.txt
jordan@ubuntu:~/Desktop$ openssl enc -aes-256-cbc -p -in plain.txt -out pl
ain.txt.enc
enter AES-256-CBC encryption password:
Verifying - enter AES-256-CBC encryption password:
*** WARNING : deprecated key derivation used.
Using -iter or -pbkdf2 would be better.
salt=10B52405173559CD
key=7DAB56298F2110BDE867AD348ABC20B5CCACD6039F081517E26B442652256EF5
iv =BCBAD1651B840D5E05CD14E185DC417F
jordan@ubuntu:~/Desktop$ S
```

Here is me encrypting a secret message in plain.txt using aes-256 code block cipher encryption algorithm.

I can decrypt it using my key that I made. But first, here is the contents of the encrypted file

```
jordan@ubuntu:~/Desktop$ cat plain.txt.enc
Salted__e$5Y/0%t{i5f0000iB00000}00Ajordan@ubuntu:~/Desktop$ S
```

```
Files jordan@ubuntu:~/Desktop$ openssl enc -aes-256-cbc -d -A -in plain.txt.enc
enter AES-256-CBC decryption password:
*** WARNING : deprecated key derivation used.
Using -iter or -pbkdf2 would be better.
some secret message
jordan@ubuntu:~/Desktop$ S
```

Here is me decrypting my message using the same key I created to encrypt it.

## 2.4 Hash Generation:

The next task is to create hash digests using ubuntu's native md5sum and sha256sum tools

I will first need to create a file to be used with hashing utilities.

```
jordan@ubuntu:~/Desktop/Lab2$ echo "Tamperproof Message: crypto is the coolest!" > message.txt
jordan@ubuntu:~/Desktop/Lab2$ md5sum message.txt
586275d781bbf077bc9b2def6848de9b message.txt
jordan@ubuntu:~/Desktop/Lab2$ sha256sum message.txt
8adc78f1bb49c8a86bbff34d9cdbeb433217820acbfa186e4556dd69e29872ce message.txt
jordan@ubuntu:~/Desktop/Lab2$
```

Here I have created a message.txt file and made md5 and sha256 hash digests for this file. Sha256 is much longer than md5.

## 2.5 Detached Digital Signature

We will now use our ubuntu vm to create a detached DS and verify it

```
jordan@ubuntu:~/Desktop/Lab2$ cat message.txt.sig
-----BEGIN PGP SIGNATURE-----

iQGzBAABCgAdFiEEqLC10cfbBWck4xc8tc3HLQI9A0QFambaCqsACgkQtc3HLQI9
A0RJiQv/X0seRE2gCHcqUsPBMPs/3Hsgbp2MtUMvYsc1QYh21mwTheIxScmZI6aB
aDKMyFiaKNEaDfAAV8xwdezQF0v6ljPdb/KgpYke3XrIXSGZmus5EaSF0VXgI23s
RMvDWuRdfVRO08NdLnkVM4/33p45y5tG0FzbrW8Uldvt53yzkxucays6M+1aNllq
FdlCmbpPTcqPbEEExgS59n+/whPhzvQG+JfIPaACl77HB5S/im46uxGb6aJqOBvc/
Fh+jlwLxEvk+G/LPrPkMZr8R+XfQJuLIRuU/+uD8YjnI4iIeceYfrzTeVD68VKv
tJbnn3j0uJoS/BwrVEzeVtfBjHtdXwLWgo37LIae1ozaAK8+BDLgpSS4B3NQ+IP+
9wXzGF+GzVzbuqLqyzvkjTQzfIu02M0TsQMioKq1Nc1TlcKM9bdwjTA/XGBf5SeE
br2Paz3FJ9AJlw45XwgjaFtRaRLYgwnPoc5MMRbTlBc4sik97UB0fteAm1AdIhBx
ISKMRN7E
=IVMW
-----END PGP SIGNATURE-----
```

Here is the digital signature that was generated.

```
jordan@ubuntu:~/Desktop/Lab2$ gpg --verify message.txt.sig message.txt
gpg: Signature made Thu 05 Sep 2024 12:46:51 PM PDT
gpg: using RSA key A8B0B5D1C7DB0560A4E3173CB5CDC72D023D0344
gpg: checking the trustdb
gpg: marginals needed: 3 completes needed: 1 trust model: pgp
gpg: depth: 0 valid: 1 signed: 0 trust: 0-, 0q, 0n, 0m, 0f, 1u
gpg: next trustdb check due at 2026-09-05
gpg: Good signature from "jordan <jordan332033@gmail.com>" [ultimate]
```

Here is the checking of the signature to make sure integrity is kept.

```
jordan@ubuntu:~/Desktop/Lab2$ nano message.txt
jordan@ubuntu:~/Desktop/Lab2$ gpg --verify message.txt.sig message.txt
gpg: Signature made Thu 05 Sep 2024 12:46:51 PM PDT
gpg: using RSA key A8B0B5D1C7DB0560A4E3173CB5CDC72D023D0344
gpg: BAD signature from "jordan <jordan332033@gmail.com>" [ultimate]
jordan@ubuntu:~/Desktop/Lab2$
```

After slightly changing the message.txt file we now have a bad signature showing that data integrity is not upheld. In a real world situation this would mean that the file was found by some third party and changed during transport.

## 2.6 - Steghide

Steghide is a steganography tool which hides data in plain site like image files. We will create a message and conceal it in an image file, then extract the secret from the image.

```
(jordan@kali)-[~]
$ sudo apt install steghide -y
Installing:
  steghide

Installing dependencies:
  libmccrypt4 libmhash2

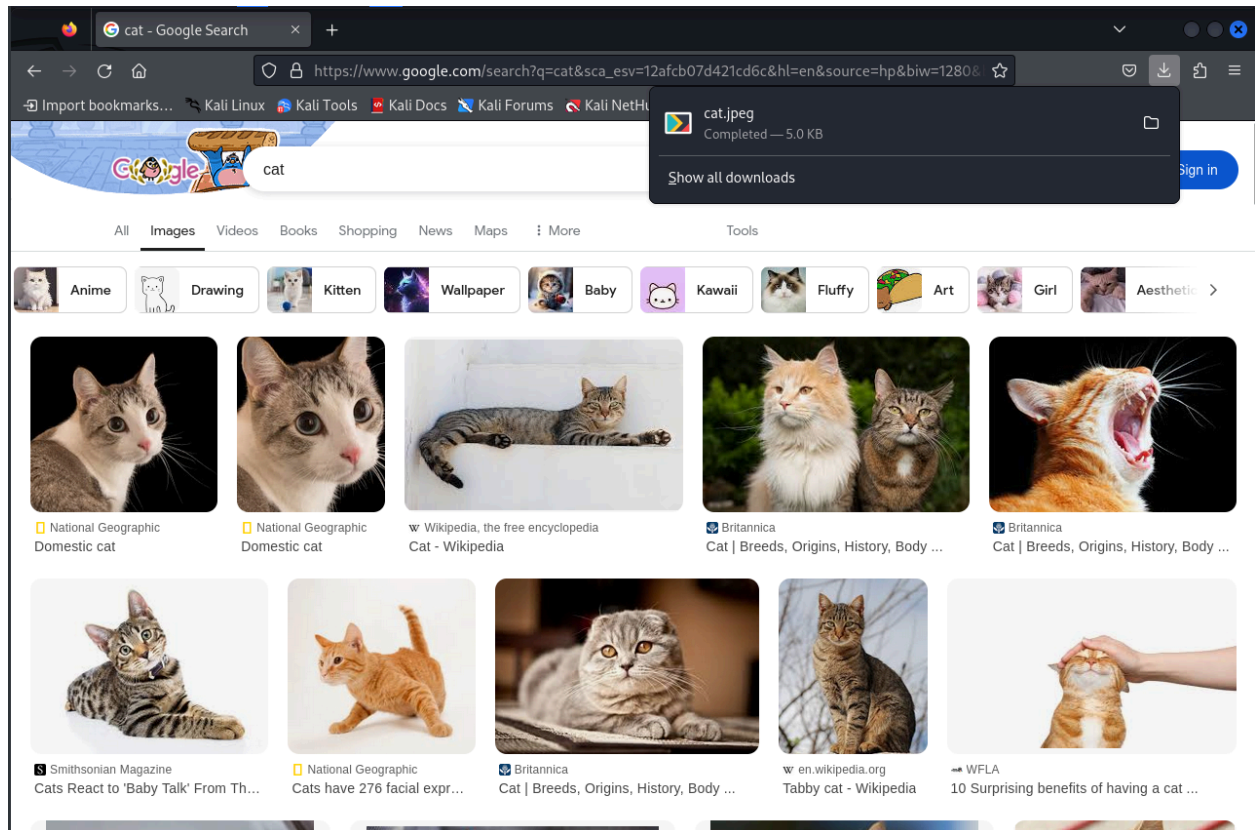

Suggested packages:
  libmccrypt-dev mcrpypt

(jordan@kali)-[~]
$
```

After updating and installing steghide, I proceeded to create a message and file

I downloaded a jpeg of a cat and created a message

```
(jordan@kali)-[~/Lab2]
$ echo "Launch Code: 31337" > secret.txt
```

We will now hide our data in this image using steghide. -ef flag is used to embed file and -cf flag is used to insert the secret message into the image.

```
(jordan@kali)-[~/Lab2]
$ steghide embed -ef secret.txt -cf cat.jpeg
Enter passphrase:
Re-Enter passphrase:
embedding "secret.txt" in "cat.jpeg" ... done
```

Our message is now embedded

Pretending we sent this to someone else, we will now extract the secret data

```
(jordan@kali)-[~/Lab2]
└─$ steghide extract -sf cat.jpeg
Enter passphrase:
the file "secret.txt" does already exist. overwrite ? (y/n) y
wrote extracted data to "secret.txt".

(jordan@kali)-[~/Lab2]
└─$

(jordan@kali)-[~/Lab2]
└─$ ls
cat.jpeg  secret.txt

(jordan@kali)-[~/Lab2]
└─$ cat secret.txt
Launch Code: 31337

(jordan@kali)-[~/Lab2]
└─$
```

We used the -sf clag to extract the message

## 2.7 Known Plaintext Attack

In this exercise we were given plain and cipher text and asked to decrypt the cipher text and explain the algorithm

Plaintext: Break my simple encryption

Ciphertext: rOe nx zlzfvrcya rlpevcgba

Just by looking at these side by side I can see one major flaw. Capital letters are still capitalized after encryption. This gives away that B = O, from there I can see that the text is scrambled in some way. My next intuition tells me that I should run this in a shift cipher brute force to see what looks similar to the plain text.

Running this into a brute forcer I found

```
➔13 (←13) eBr ak mymsiepln eycripton
```

This looks just like the plain text but scrambled.

eBr,\_ak,my,msi,epl,n\_e,ycr,ipt,on

I have uncovered the algorithm used. It is a 13 shift cipher using a uniform scrambling technique. For every 3 chars abc, they are transformed to cab. I showed

this in my above example where I replaced spaces with an underscore and segmented each 3 chars with a comma.
